Secure Fit Restraint Mitt

Prisons / Prisoner Transport / Law Enforcement / Psychiatric Detainees
Summer 2016

New, Patent-Pending Restraint Mitt for Protecting Guards, Officers, Detainees and Staff

Renco's Secure Fit Restraint Mitts protect officers and staff when working with prisoners, detainees and psychiatric patients. These mitts were conceived and patented by a disabled American Veteran. While working as a guard in a US Federal Prison he witnessed, first-hand, an inmate escape from handcuffs, which is the current security precaution while prisoners are being transported. Transportation is the highest-risk time for escapes and it has been estimated that greater than 10% of the jail and prison population is transported every day.

Over the past month, several high-profile escapes have occurred which have resulted in the shooting deaths and injuries to court officers in Michigan. Since 2007, there have been over 400 escapes in the US resulting in more than 5 officers killed, 20 officers injured and seven prisoners killed. The national average is 1.28 escapes/day. Renco's Safety Mitt is a visual indicator that all is well or that something is amiss and can be used for prisoner transport, court hearings, psychiatric wards, jails, prisons and Military Police.

The Secure Fit Restraint Mitt has been developed, manufactured and commercialized by Renco Corporation, a company with 50+ years in safety and security products including hand-protection and body armor.

The patent-pending mitts are produced in the USA from durable, cut-resistant Kevlar and premium natural leather.
